1 of 2 . For $V^{+}=+24 \mathrm{~V}, R_{1}=1 \mathrm{M} \Omega, R_{2}=1.5 \mathrm{M} \Omega, K=4 \times 10^{-4} \mathrm{~S}$, and $V_{T O}=1.5 \mathrm{~V}$, solve for $R_{S}$ for $I_{D}=2.5 \mathrm{~mA}$. Reference equation: $i_{D}=K\left(v_{G S}-V_{T O}\right)^{2}$.

2 of 2 . The circuit on the left is the signal circuit for a CE amplifier. The two circuits on the right show the hybrid- $\pi$ model for the circuit. For $R_{B}=2.2 \mathrm{k} \Omega, R_{C}=10 \mathrm{k} \Omega, I_{C}=1.5 \mathrm{~mA}$, and $V_{C E}=10 \mathrm{~V}$, solve for the voltage gain $A_{v}=v_{c} / v_{s}$. For the transistor, assume $\beta=100, V_{A}=75$, and $V_{T}=25 \mathrm{mV}$. Reference equations: $i_{c}^{\prime}=g_{m} v_{\pi}=\beta i_{b}=\alpha i_{e}^{\prime}, r_{\pi}=V_{T} / I_{B}, g_{m}=I_{C} / V_{T}, I_{C}=\beta I_{B}, r_{0}=\left(V_{A}+V_{C E}\right) / I_{C}$.
